

ARCH PAIN/ARCH STRAIN

Definition

The term arch pain refers to an inflammation and/or burning sensation at the arch of the foot.

Cause

There are many different factors that can cause arch pain. A structural imbalance or an injury to the foot can often be the direct cause. However, most frequently the cause is a common condition called plantar fasciitis.

The plantar fascia is a broad band of fibrous tissue located along the bottom surface of the foot that runs from the heel to the ball of the foot. Excessive stretching of the plantar fascia, usually due to over-pronation (flat feet), causes plantar fasciitis.

The inflammation caused by the plantar fascia being stretched away from the heel often leads to pain in the heel and arch areas. The pain is often extreme in the morning when an individual first gets out of bed or after a prolonged period of rest.

If this condition is left untreated and strain on the longitudinal arch continues, a bony protrusion may develop, known as a heel spur. It is important to treat the condition promptly before it worsens.

Treatment and Prevention

This is a very common foot condition that can be easily treated. If you suffer from arch pain avoid high-heeled shoes whenever possible. Try to choose footwear with a reasonable heel, but not completely flat shoes. Use ice to relieve pain, do not walk in bare feet, and try to massage the arch of the foot. You will need to have an appropriate person determine if the pain is pronation related. When the arch pain is pronation related (flat feet), a custom made foot orthotic from a cast, designed with proper arch support is recommended for treating the pain. This type of orthotic will control over-pronation, support the arch and provide the necessary relief.

If the problem persists, call Body Care Solutions on (03) 9699 2998 and consult your Podiatrist or Orthotist.
